EDUCATION

Madhuben and Bhanubhai Patel Institute of Technology, Anand, Gujarat *2023 – Present B.Tech, Information Technology | CGPA: 7.69 / 10.0*

TECHNICAL SKILLS

Languages: Python, JavaScript, Java, C, C++, HTML5, CSS3
Frameworks & Libraries: React.js, Next.js 14 (App Router), Node.js, Tailwind CSS, Mongoose, Recharts, Leaflet.js
AI / ML: Google Gemini API, OpenAI GPT-4o, Roboflow (CV), EfficientNet-B0, Bidirectional LSTM, TensorFlow/Keras
Databases & Cloud: MongoDB Atlas, SQL, Supabase, Cloudinary, Vercel, JWT, bcrypt, Zod, node-cron, Resend API
Tools: Git, GitHub, REST API Design, Role-Based Access Control, Geospatial Queries, i18n

PROJECTS

CivicPulse — AI-Powered Civic Issue Management Platform *2024 – 2025*
Next.js 14 · React · MongoDB · Google Gemini · OpenAI · Roboflow · Cloudinary · Tailwind CSS · Vercel

- Architected a full-stack production platform bridging citizens and municipal government, supporting 5 distinct user roles (Citizen, Field Officer, Department Manager, Commissioner, Admin) with JWT + Edge Runtime (jose) authentication
- Engineered a 3-layer AI classification pipeline — Roboflow pothole detection → Gemini 1.5 Flash photo verification & category auto-detection → OpenAI GPT-4o fallback — eliminating manual issue classification entirely
- Designed an automated SLA enforcement engine with 4 priority tiers (24h–120h deadlines), 3-level escalation hierarchy, and node-cron scheduled checks, reducing unresolved issue backlog by enforcing accountability at each tier
- Built a geospatial duplicate detection system using MongoDB $near queries with Leaflet.js interactive maps and react-leafletcluster, preventing redundant reports across civic wards
- Implemented full transactional email pipeline via Resend API covering 6 event types (submission, assignment, status updates, SLA breach, resolution, rating request) and added i18n multilingual support with browser-language auto-detection

CogniScan Pro — Real-Time Cognitive Load Estimation System *2024 – 2025*
Python · TensorFlow/Keras · EfficientNet-B0 · Bidirectional LSTM · OpenCV · Deep Learning

- Designed a novel dual-branch deep learning architecture fusing EfficientNet-B0 (spatial frame-level feature extraction from facial images) with Bidirectional LSTM (temporal sequence modeling across video frames) for real-time cognitive load classification
- Implemented end-to-end training pipeline — data preprocessing, augmentation, dual-branch feature fusion, and 4-class classification (Low / Medium / High / Overload) — with real-time inference from live webcam feed
- Achieved robust classification accuracy on benchmark cognitive load datasets; model has direct applicability in adaptive elearning, driver fatigue detection, and UX research systems

BharatHire AI — Career Intelligence Platform (In Progress) *2026*
React · Supabase · Claude API · Tailwind CSS · Vercel | OceanLab X CHARUSAT Hacks 2026

- Building India's first AI career co-pilot for Tier 2/3 students — delivering dual ATS + Human Readability scoring, Naukri vs LinkedIn cross-profile consistency checking, and a 30-day personalized skill roadmap generator
- Identified a critical market gap through research: existing tools (Jobscan, ResumeWorded) are US-centric and ignore India's 57.4% graduate employability crisis; product directly addresses this with India-specific context

HACKATHONS & ACHIEVEMENTS

OceanLab X CHARUSAT Hacks 2026 *April 2026*

48-Hour AI-First SaaS Hackathon · Open Innovation Track · DEPSTAR, CHARUSAT

- Selected Open Innovation track to build BharatHire AI — a research-backed, India-specific career intelligence platform for Tier 2/3 students competing against 400–500 participants

CVMU Hackathon 4.0 *2024*

Charotar Vidya Mandal University

- Competed in 24-hour hackathon environment; built and demonstrated a working technical prototype under strict time constraints
